

CLAIM AMENDMENTS

What I claim is:

- 1 1. (original) A method for hydraulic fracturing of a formation around a wellbore, the wellbore
2 having a volume, comprising:
 - 3 (a) placing a volume of cross-linked fracturing fluid in the wellbore, the volume of the cross-
4 linked fracturing fluid being less than the volume of the wellbore;
 - 5 (b) displacing the cross-linked fracturing fluid down to a perforation in the casing by a
6 displacement fluid; and
 - 7 (c) applying pressure to the displacement fluid by pumping so as to inject the cross-linked
8 fracturing fluid through the perforation into the formation to form a hydraulic fracture.
- 1 2. (original) The method of claim 1 wherein the cross-linked fracturing fluid has a viscosity
2 greater than about 500 cP at a temperature of injection into the formation.
3
- 1 3. (original) The method of claim 1 wherein the cross-linked fracturing fluid has a viscosity
2 greater than about 2,000 cP at a temperature of injection into the formation.
3
- 1 4. (original) The method of claim 1 wherein the cross-linked fracturing fluid has a viscosity
2 greater than about 10,000 cP at a temperature of injection into the formation.
- 1 5. (original) The method of claim 1 wherein step (a) is performed by placing the cross-linked
2 fracturing fluid in the wellbore in the form of discrete volumes of fluid in a carrier fluid.

1 6. (original) The method of claim 1 wherein step (a) is performed by placing the cross-linked
2 fracturing fluid into a stream having a carrier fluid at a concentration such that the cross-linked
3 fracturing fluid flows on a film of carrier fluid.

1 7. (original) The method of claim 1 wherein step (a) is performed by placing the cross-linked
2 fracturing fluid in the wellbore and allowing the fluid to fall by gravity down the wellbore.

1 8. (original) The method of claim 1 wherein at least a portion of the cross-linked fracturing
2 fluid contains a proppant.

1 9. (original) The method of claim 1 further comprising the step after step (b) of allowing a
2 time for the cross-linked polymer to decrease in viscosity.

3
1 10. (original) The method of claim 1 further comprising the steps of forming a hydraulic
2 fracture in the formation around the wellbore and then performing steps (a) and (b) and injecting
3 the cross-linked fracturing fluid into the hydraulic fracture before closure of the hydraulic
4 fracture.

5
1 11. (original) The method of claim 1 further comprising the step of forming a hydraulic fracture
2 in the formation around the wellbore and then performing steps (a) and (b) and injecting the
3 cross-linked fracturing fluid into the hydraulic fracture after closure of the hydraulic fracture.

4

1 12. (original) The method of claim 1 further comprising the step of performing another operation
2 in the wellbore after step (c) and before a time for the cross-linked fracturing fluid to degrade.

3
1 13. (original) The method of claim 12 wherein the other operation in the wellbore is gravel
2 packing.

3
1 14. (cancelled) The method of claim 1 wherein a portion of the cross-linked fracturing fluid
2 contains a proppant.

3
1 15. (original) The method of claim 1 further comprising the step for transporting ball sealers
2 down the wellbore along with or following the cross-linked fracturing fluid.

3
1 16. (original) The method of claim 1 wherein the cross-linked fracturing fluid comprises a
2 water-soluble polymer.

3
1 17. (original) The method of claim 1 wherein the cross-linked fracturing fluid is selected to
2 exhibit syneresis.

3
1 18. (original) The method of claim 1 wherein the cross-linking of the cross-linked fracturing
2 fluid is delayed after a cross-linking material is added to the fluid.

3
1 19. (original) The method of claim 1 wherein a surfactant or polymer is added to the cross-
2 linked fracturing fluid to promote wall slip during flow of the cross-linked fracturing fluid.

3

1 20. (original) The method of claim 6 wherein a surfactant or polymer is added to the carrier
2 fluid to promote wall slip during flow of the cross-linked fracturing fluid.

3

1 21. (original) The method of claim 1 wherein the cross-linked fracturing fluid is displaced from
2 the wellbore by a fluid having a lower specific gravity than the specific gravity of the cross-
3 linked fracturing fluid.

1 22. (original) The method of claim 1 wherein the cross-linked fracturing fluid occupies about
2 200 feet or less in the casing above the perforation.

3

1 23. (original) The method of claim 1 wherein the volume of the cross-linked fracturing fluid is
2 less than about 50 ft³.

3

1 24. (original) The method of claim 1 wherein the volume of the cross-linked fracturing fluid is
2 less than about 250 ft³.
